**SLPowers Adds new Digital Disaster Recovery Product to Guaranteed Networks®
Product Line**

GN Restore™ Gets Your Network Back Online in 1 Hour After Catastrophic Event

Boca Raton, FL – April 3, 2007 -- Before you risk your time and money settling on a tape backup or remote Internet data backup as your Business Continuity plan, consult the experts at SLPowers. Florida's premier computer and network management company has come up with a solution for small and medium companies nationwide to backup your data *and programs* across the Internet, reducing time to restore your entire network—not just your data—to as little as one hour. SLPowers is proud to announce **GN Restore™**, the premier business continuity product. Their professionals can help you quickly restore your business in the event of any disaster.

Many businesses are under the impression that a tape backup with an off-site copy is enough to provide them with Business Continuity if a mishap takes place. What they do not realize is that, with only a tape backup of their business data, they will need to take many more steps before they are up and running again. This includes: ordering and receiving a replacement server compatible with their software; making sure it has a tape drive compatible with their tapes; loading the server software and setting up their users with the correct security rights; reinstalling their application programs on PC's; and reloading their data. All of this could take weeks. It would be virtually unachievable for a business to outlast this lengthy delay.

According to SLPowers, many companies are offering remote, tapeless data backups across the Internet with the promise that a business will be able to retrieve their data from a remote location. These services guarantee security and accessibility, but within this pledge is a major problem. It could take days or weeks to recover the amount of data most business clients need to safeguard, and a business still needs more than just data to recover. It takes much longer to retrieve data across the Internet than from a tape or hard drive. Remote data backup offers a misleading sense of security.

Professionals at SLPowers ensure that with **GN Restore™**, you will have your essential programs up and running in a fraction of the time of either standard tape or remote data backup solutions. They have founded relationships with secure data centers in California, Maryland, Florida and Nevada for data and infrastructure reproduction, with the awareness that their own local facilities could also be affected by a disaster.

Once you have your vital functions running, you will have the ability to restore your business to its complete state. While other businesses might not be ready, yours will still be able to serve what matters most: your customers. Please call or visit www.SLPowers.com for further information.
